

DH Labs Air Matrix Interconnect

<http://www.silversonic.com/>

No, not Pol Pot the Laotian dictator...Paul Potts the opera singer! It was an easy mistake to make. But, I'll bet you're wondering what it has to do with the DH Labs ***Air Matrix*** interconnect. Well, it's pretty easy if you'll bear with me.

You see, many years ago I listened to the DH Labs T-14 speaker cable at the recommendation of a dear friend and colleague from the high end biz. I was *very* impressed; it was a superb cable. But, the T-14 (at least of *that* era) reminded me of the voice of Paul Potts the opera singer; it was sweet and refreshingly clear but it lost its harmonic richness by the upper range. I know I'm being mean to both the singer and a budget speaker cable but I am building up to a very important point about the DH Labs ***Air Matrix*** interconnect.

The Good: The DH Labs ***Air Matrix*** interconnect is an harmonically complete and organic sounding as any interconnect I have *ever* used.

The Not Quite as Good: It's a little stiff and I don't much care for locking RCAs.

You're right, those are pretty feeble weaknesses, I know. But I really cannot come up with many faults. The DH Labs ***Air Matrix*** has shown me just how far cable designs have progressed over the years. The cables has the delicacy of some unique hand made cables I heard many years ago. They were unshielded one-offs from a now-defunct company and used masking tape for dielectric. No kidding. They sounded superb but were as difficult to use as you would imagine. These cables from DH Labs match or exceed that transparency and bring it together with a full and easy musicality that makes me sink back in my chair, helplessly immersed in the music. The ***Air Matrix*** has a lightness of sound until the music becomes heavy and more complex. These cables allow the system to breathe. They are harmonically correct and cat-quick in response to transient-rich material. The only deviations from neutrality will come from the variances of the source material. A better cable I haven't heard.

No need to say more. Buy a pair of DH Labs ***Air Matrix*** today. No matter what interconnect you're using now, you just upgraded your entire system. *Enjoy!*
